

Bellwork:

Factor:

$$2x^2 + 14x + 12$$

$$\begin{aligned} & (2x+2)(x+6) \\ & 2(x+1)(x+6) \end{aligned}$$

Sep 26-1:42 PM

Chapter 4.1: Graph Quadratic Functions in Standard Form

- A quadratic function is a function that can be written in the standard form
The graph of a quadratic forms a parabola.

$$y = ax^2 + bx + c, a \neq 0$$

Sep 27-6:45 AM

Parent Function

$$f(x) = x^2$$

$$y = x^2$$

X	y
-3	9
-1	1
0	0
1	1
3	9

Axis of Symmetry

Vertex

$$x = 0$$

Sep 27-6:48 AM

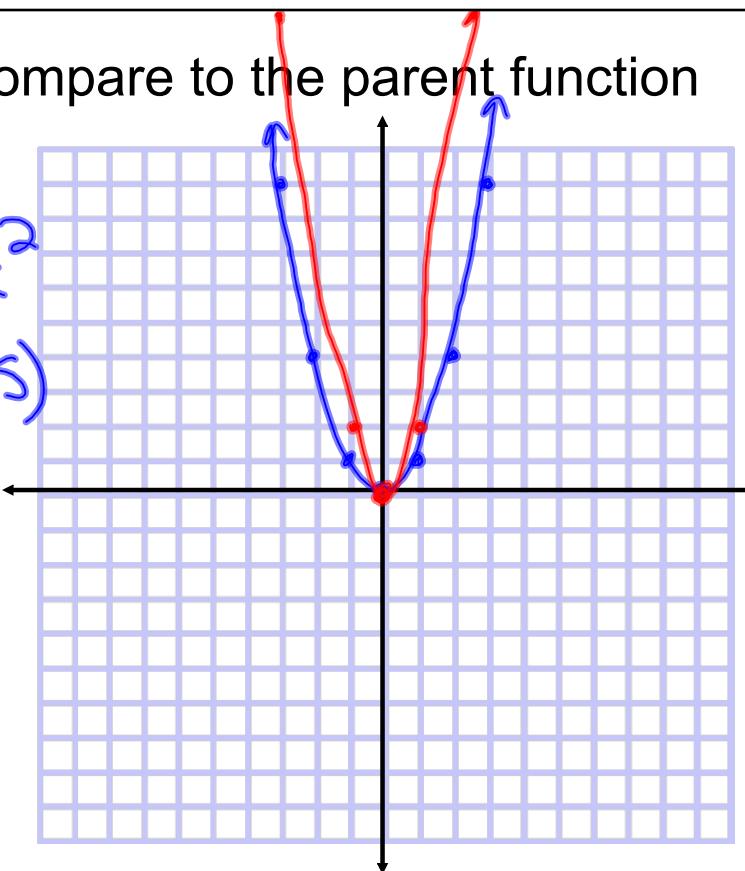

ex. Graph and compare to the parent function

$$y = 2x^2$$

X	y
-3	18
-1	2
0	0
1	2
3	18

$$5x^2$$

$$(1, 5)$$

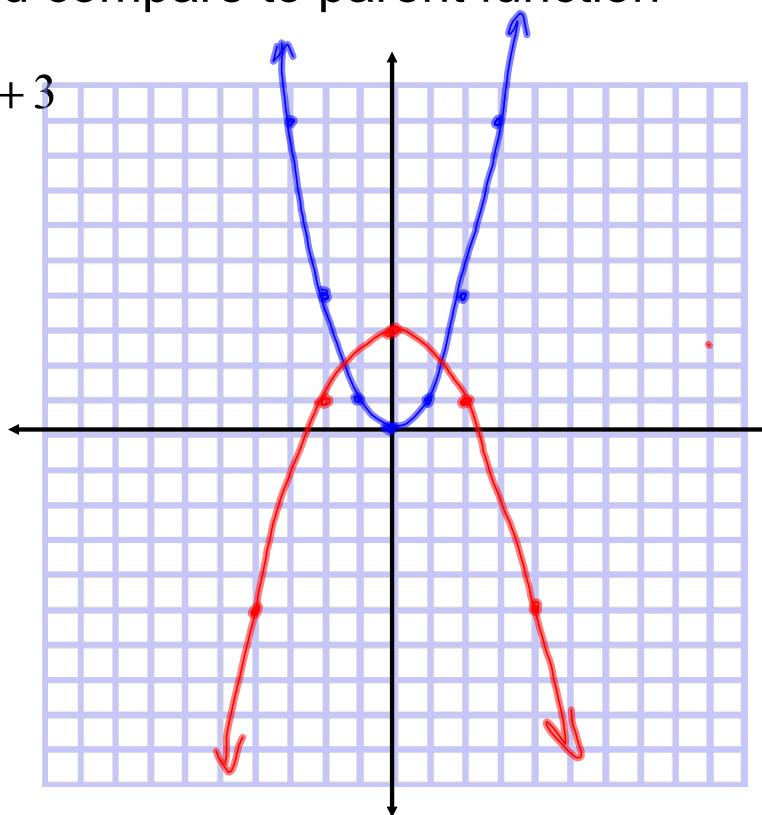

Sep 27-6:50 AM

ex. Graph and compare to parent function

$$f(x) = -\frac{1}{2}x^2 + 3$$

x	y
-4	-5
-2	-1
0	3
2	-1
4	-5

Sep 27-6:51 AM

Properties:

$$y = \underline{ax^2 + bx + c}$$

if $a < 0$ opens down

if $a > 0$ opens up

if a is a fraction, wider

if a is a whole number, narrower.

axis of symmetry

$$x = -\frac{b}{2a}$$

y intercept

$$(0, c)$$

Sep 27-6:52 AM

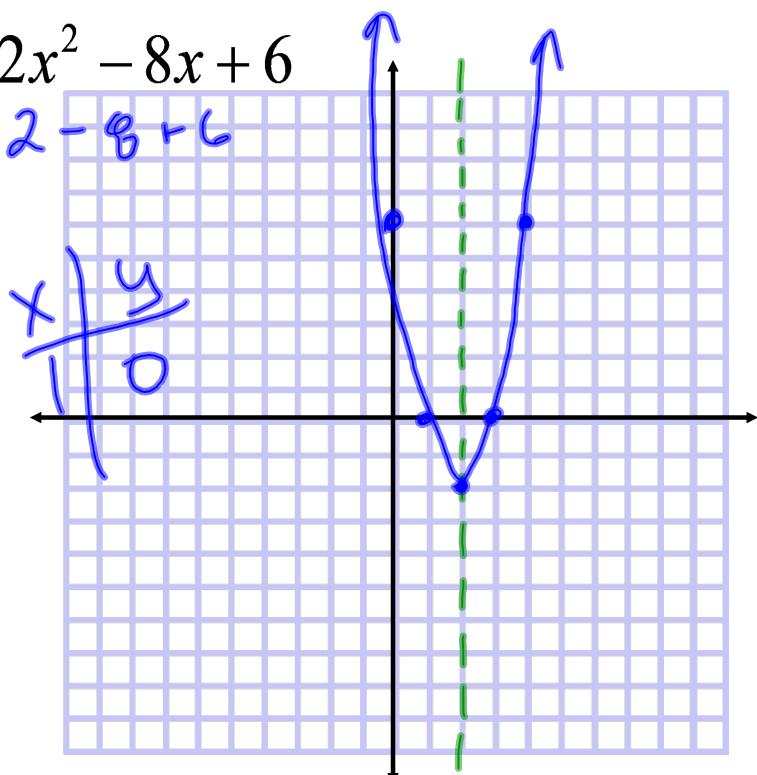

ex. graph $y = 2x^2 - 8x + 6$

$$X = \frac{-b}{2a}$$

$$X = \frac{-(-8)}{2(2)}$$

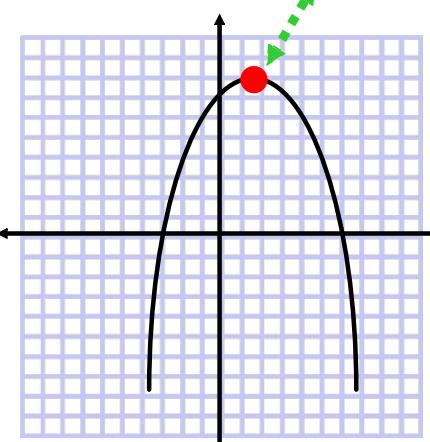

$$X = \frac{8}{4} = 2$$

Vertex
(2, -2)

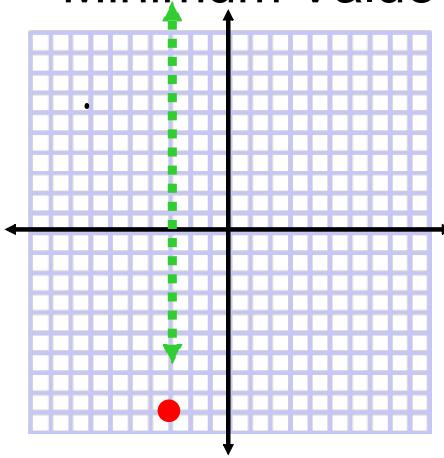

Sep 27-6:56 AM

Maximum Value

$$a < 0$$

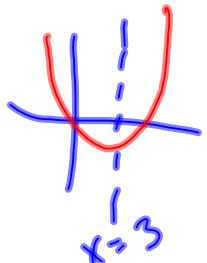

Minimum Value

$$a > 0$$

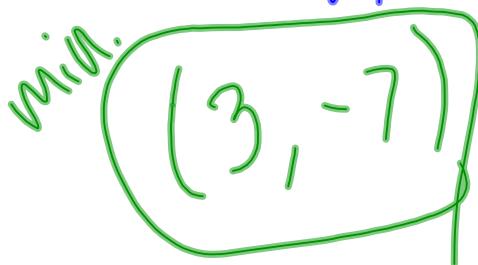

Sep 27-6:57 AM

ex. Tell if there is a maximum or minimum value. What is it? $y = 3x^2 - 18x + 20$

$$x = \frac{-b}{2a} = \frac{-18}{2(3)} = \frac{18}{6} = 3$$

$$3(3)^2 - 18(3) + 20 \\ 27 - 54 + 20 = -7$$

Sep 27-6:59 AM

ex. A go-cart track has about 380 racers per week and charges each racer \$35 to race. The owner estimates that there will be 20 more racers per week for every \$1 reduction in the price per racer. How can the owner of the go-cart track maximize weekly value?
