# **Pre-Algebra** Equation of a Line From Two Points May 20, 2020

### Pre-Algebra Lesson: May 20, 2020

### **Objective/Learning Target:** I can write an equation given two points.

### Warm-Up:

#### Match each term with its correct definition or formula.

1)	Slope
2)	Y-intercept
3)	Linear Equation
4) 5	Slope Intercept form

A)	The point where a line crosses the y-axis
B)	y = mx + b
C)	<u>Rise</u> Run
D)	An equation with two variables that graphs as a straight line

## Warm-Up: Answer Key

## **Review:** How to Count Slope from a Graph

The graph passes through the points (-2, -1) and (2, 4). Slope =  $\frac{\text{Rise}}{\text{Run}}$ =  $\frac{4 - (-1)}{2 - (-2)}$ =  $\frac{5}{4}$ 

The graph passes through the points (-3, 3) and (1, -1). Slope =  $\frac{\text{Rise}}{\text{Run}}$ =  $\frac{-1-3}{1-(-3)}$  =  $\frac{-4}{4}$  = -1

The slope is -1.

## **Review:** How to Use the Slope Formula

Find the slope of the line that goes through the points (2,5) and (4,8).

Step 1: Label the points. It doesn't matter which one you pick as "Point 1" and "Point 2."

Remember the x's are listed first in an ordered pair and the y's are listed second.

(2,5) and (4,8) <sup>↑</sup> <sup>↑</sup> <sup>↑</sup> <sup>↑</sup> X<sub>1</sub> Y<sub>1</sub> X<sub>2</sub> Y<sub>2</sub>

**Step 2**: Plug in the values. Subtract the y's on the top, subtract the x's on the bottom. Make sure to subtract in the same order in the numerator and denominator.

Slope = 
$$\frac{y_2 - y_1}{x_2 - x_1} = \frac{8 - 5}{4 - 2} = \frac{3}{2}$$

**Step 3**: Make sure your answer is simplified. 3/2 cannot be reduced, so we leave the answer as

3/2.

## **Review:** What is an Intercept?

There are two axes on the coordinate plane: the x-axis and the y-axis.

When your line crosses one of those axes, it is called an intercept.

For slope-intercept form, we want to find the **y** - **intercept**: The point where the line crosses the y-axis.

## **Review:** Equation in Slope-Intercept Form

Example:  

$$y = 2x + 3$$
  
 $1$   $y = 2x + 3$   
 $(0,3)$  is the y-intercept

## Video:

Take notes on a piece of paper as you watch this video.

Write an equation of a line in slope-intercept form that passes through (-3, -1) and (6, -4) $m = -\frac{1}{3}$ y = mx + b $-4 = -\frac{1}{3}(6) + b$ -4 = -2 + b

## How To: Write an Equation from Two Points on a Graph

① Count the slope between the two points.

Between these two points, you would count down 8 units and right 4 units, so the slope is -8/4 or -2

② Find the y-intercept on the graph. The y-intercept is given. It is (0,-4).

③ Plug the slope and y-intercept into the equation in slope-intercept form.

$$y = -2x - 4$$

## Example 1:

#### ① Count the slope between the two points.

Between these two points, you would count up 2 units and right 2 units, so the slope is 2/2 or 1

#### ② Find the <mark>y-intercept</mark> on the graph.

The y-intercept is <u>not given</u>. Use the slope to create more points, or draw a line through both points using a straightedge to see where it crosses the y-axis.

(See example to the right.) You would find the point (0,2). This is the y-intercept.

or

v = 1x + 2

③ Plug the slope and y-intercept into the equation in slope-intercept form.

## Example 2:

(1) Count the slope between the two points. Between these two points, you would count down 3 units and right 2 units, so the slope is -3/2

#### ② Find the **y-intercept** on the graph.

The y-intercept is <u>not given</u>. Use the slope to create more points, or draw a line through both points using a straightedge to see where it crosses the y-axis.

v = -3/2x + 0

(See example to the right.) You would find the point (0,0). This is the y-intercept.

or

③ Plug the slope and y-intercept into the equation in slope-intercept form.

### **How To: Write an Equation** *from Two Points*

Write the equation in slope-intercept form of a line that passes through the points (0, -5) and (1, -4).

(1) Find the slope: Plug the points into the <u>Slope Formula</u>. Notice:  $x_1=0$   $y_1=-5$   $x_2=1$   $y_2=-4$ The formula is:  $y_2 - y_1$  To set it up: -4 - -5 Solve/Reduce: 1  $x_2 - x_1$  or 1

② Find the y-intercept: Plug in one point into the slope-intercept equation. The y-intercept was given! It is (0,-5).

**③** Write the equation in slope-intercept form.

$$y = 1x - 5 \quad \text{or} \quad y = x - 5$$

### **Example 3**:

Write the equation in slope-intercept form of a line that passes through the points (-4, -3) and (0, 2).

1) Find the slope: Plug the points into the <u>Slope Formula</u>. Notice:  $x_1 = -4$   $y_1 = -3$   $x_2 = 0$   $y_2 = 2$ The formula is:  $y_2 - y_1$  To set it up: 2 - -3 Solve/Reduce: 5 $x_2 - x_1$  0 - -4 4

② Find the y-intercept: Plug in one point into the slope-intercept equation. The y-intercept was given! It is (0,2).

**③** Write the equation in slope-intercept form.

$$y = \frac{5}{4}x + 2$$

## **Example 4**:

Write the equation in slope-intercept form of a line that passes through the points (-4,-2) and (4,4).

1) Find the slope: Plug the points into the Slope Formula. Notice:  $x_1 = -4$   $y_1 = -2$   $x_2 = 4$   $y_2 = 4$ The formula is:  $y_2 - y_1$  To set it up:  $\frac{4 - -2}{4 - -4}$  Solve/Reduce:  $\frac{6}{8}$  or  $\frac{3}{4}$ 

(2) Find the y-intercept: Plug in one point into the slope-intercept equation. The formula: y = mx + b. Use  $\frac{3}{4}$  for slope (m) and use the point (4,4). Set it up:  $4 = \frac{3}{4}(4) + b$  4 = 3 + b -3 - 31 = b

**③ Write the** equation in slope-intercept form.

$$y = \frac{3}{4}x + 1$$

### Practice 1:

#### Answers on next slide

#### Find the equation of each line. (Two points are given.)

### Practice 1:

Answer Key
