College Prep Algebra
Lesson: May 8, 2020

Objective/Learning Target:
To solve rational equations, using the LCM
to reduce to Linear Equations

Let's get started!

On May 5 we determined the LCM of denominators in a rational equation

Many mathematicians would like to avoid fractions in their equations, if possible. Just like you!

So they found **ANOTHER WAY** to use the LCM to make the equation they are solving have **NO MORE FRACTIONS!**

That's what we are going to do today! It is a different technique that allows you to solve rational equations.

1) Solve the rational equation.

May 5
The LCM

$$\frac{1}{x^2} + \frac{4}{x} = \frac{3}{x^2}$$

$$\text{LCM} = x \cdot x \text{ or } x^2$$

Look at what happens when we **multiply** each term of the equation **with the LCM**

Multiply
with LCM

$$\frac{\text{LCM}}{1} \cdot \frac{1}{x^2} + \frac{\text{LCM}}{1} \cdot \frac{4}{x} = \frac{\text{LCM}}{1} \cdot \frac{3}{x^2}$$

Cancel
common top
with bottom

$$\frac{\cancel{x^2}}{1} \cdot \frac{1}{\cancel{x^2}} + \frac{x \cdot \cancel{x}}{1} \cdot \frac{4}{\cancel{x}} = \frac{\cancel{x^2}}{1} \cdot \frac{3}{\cancel{x^2}}$$

Simplify what remains

$$1 + 4x = 3$$

NO MORE FRACTIONS!!!

2) Solve the rational equation

- Multiply by LCM
- Cancel common factors

May 5
The LCM

$$\frac{4}{x+1} + \frac{1}{x^2 - 5x - 6} = \frac{1}{x-6}$$

$$\text{LCM} = (x+1)(x-6)$$

$$\frac{\text{LCM}}{(x+1)(x-6)} \cdot \frac{4}{\cancel{(x+1)}} + \frac{\text{LCM}}{(x+1)(x-6)} \cdot \frac{1}{\cancel{(x+1)(x-6)}} = \frac{\text{LCM}}{(x+1)(x-6)} \cdot \frac{1}{\cancel{(x-6)}}$$

Simplify what remains

$$4x - 24 + 1 = x + 1$$

3) Solve the rational equation

May 5
The LCM

$$\frac{x^2 - 3x - 4}{x^3 - x^2} - \frac{1}{x^2} = \frac{x - 2}{x^2}$$

$$\text{LCM} = x^2(x - 1)$$

- Multiply by LCM
- Cancel common factors

$$\frac{\overset{\text{LCM}}{\cancel{x^2(x-1)}}}{1} \cdot \frac{x^2 - 3x - 4}{\cancel{x^2(x-1)}} - \frac{\overset{\text{LCM}}{\cancel{x^2(x-1)}}}{1} \cdot \frac{1}{\cancel{x^2}} = \frac{\overset{\text{LCM}}{\cancel{x^2(x-1)}}}{1} \cdot \frac{(x-2)}{\cancel{x^2}}$$

Simplify what remains

$$x^2 - 3x - 4 - x + 1 = x^2 - 1x - 2x + 2$$

4) Solve the rational equation

May 5
The LCM

$$1 - \frac{3}{x^2 + 3x - 4} = \frac{x - 2}{x - 1}$$

$$\text{LCM} = (x + 4)(x - 1)$$

- Multiply by LCM
- Cancel common factors

$$\frac{\text{LCM}}{(x + 4)(x - 1)} \cdot 1 - \frac{\text{LCM}}{(x + 4)(x - 1)} \cdot \frac{3}{(x + 4)(x - 1)} = \frac{\text{LCM}}{(x + 4)(x - 1)} \cdot \frac{(x - 2)}{(x - 1)}$$

Simplify what remains $x^2 + 4x - 1x - 4 - 3 = x^2 + 4x - 2x - 8$

Practice:

On May 5, you found the LCM of the equations on this worksheet.

Use your LCM from May 5 to write the equations so that the equations no longer have fractions. Check your solutions on the following pages.

[Practice Worksheet](#)

Read the tops of the fractions.

Compare with your equation without fractions.

They should MATCH!

$$1) \frac{1}{6k^2} = \frac{2}{6k^2} + \frac{-6k}{6k^2}$$

$$2) \frac{2}{2n^2} + \frac{2n}{2n^2} = \frac{1}{2n^2}$$

$$3) \frac{1}{6b^2} + \frac{b}{6b^2} = \frac{6}{6b^2}$$

$$4) \frac{b+6}{4b^2} + \frac{6}{4b^2} = \frac{2b+8}{4b^2}$$

$$5) \frac{5}{5x} = \frac{6}{5x} + \frac{5x}{5x}$$

$$6) \frac{1}{6x^2} = \frac{3x}{6x^2} + \frac{7}{6x^2}$$

$$7) \frac{v-5}{v(v-5)} + \frac{3v+12}{v(v-5)} = \frac{7v-56}{v(v-5)}$$

$$8) \frac{1}{m(m-1)} + \frac{m-1}{m(m-1)} = \frac{5}{m(m-1)}$$

$$9) \frac{1}{n-8} + \frac{-n+8}{n-8} = \frac{7}{n-8}$$

$$10) \frac{r-5}{(r-5)(r-2)} + \frac{1}{(r-5)(r-2)} = \frac{6r-30}{(r-5)(r-2)}$$

$$11) \frac{v-4}{v-4} = \frac{v+2}{v-4} + \frac{7v-42}{v-4}$$

$$12) \frac{r-4}{5r} = \frac{1}{5r} + \frac{5r}{5r}$$

$$13) \frac{3x}{3x} + \frac{x^2-5x-24}{3x} = \frac{x-6}{3x}$$

$$14) \frac{x^2+2x}{x(x+2)} = \frac{1}{x(x+2)} + \frac{x^2+2x-x-2}{x(x+2)}$$

$$15) \frac{n^2+n+5n+5}{(n+8)(n+1)} = \frac{n^2+8n+1n+8}{(n+8)(n+1)} + \frac{6n+48}{(n+8)(n+1)}$$

$$16) \frac{r+5}{r(r-2)} - \frac{r^2-2r}{r(r-2)} = \frac{1}{r(r-2)}$$

$$17) \frac{1}{x(x-5)} = \frac{x^2+7x-5x-35}{x(x-5)} + \frac{-x^2+5x}{x(x-5)}$$

$$18) \frac{a^2 - 2a + 2a - 4}{(a+3)(a+2)} + \frac{-a^2 - 3a - 2a - 6}{(a+3)(a+2)} = \frac{3a+9}{(a+3)(a+2)}$$

$$19) \frac{p+5}{p(p+1)} = \frac{1}{p(p+1)} + \frac{-p^2+6p}{p(p+1)}$$

$$20) \frac{5}{n^2(n+5)} = \frac{4n^2}{n^2(n+5)} + \frac{n+5}{n^2(n+5)}$$
