Addition of Velocities

Students will learn how vector addition enables us to add velocities in two dimensions to get a resultant velocity.

Quick Review

- a) Tad drops a cherry pit out the car window 1.0 m above the ground while traveling down the road at 18 m/s. How far, horizontally, from the initial dropping point will the pit hit the ground?

- b) If the car continues to travel at the same speed, where will the car be in relation to the pit when it lands?

Quick Review Answers

a)

$$\Delta y = -1.0 \text{ m}$$

$$v_{xi} = 0$$

$$a = g = -10 \frac{\text{m}}{\text{s}^2}$$

$$v_x = 18 \frac{\text{m}}{\text{s}}$$

$$\Delta t = ?$$

$$\Delta x = ?$$

$$\Delta y = v_{yi}t + \frac{1}{2}a\Delta t^2 \Rightarrow t = \sqrt{\frac{2\Delta y}{a}} = \sqrt{\frac{2(-1.0\text{m})}{-10 \frac{\text{m}}{\text{s}^2}}} = 0.45 \text{ s}$$

$$\Delta x = v_x \Delta t \Rightarrow \Delta x = 18 \frac{\text{m}}{\text{s}}(0.45\text{s}) = 8.0 \text{ m}$$

b)

Tad will be directly above the cherry pit when it hits the ground.

Addition of Velocities

Link: [Addition of Velocities](#)

Directions:

- Read through the section on Addition of Velocities..
- Work through the examples on a separate piece of paper before you scroll down to the solution.
- On a separate piece of paper complete the practice problems on the following slides.
- Check your answers.
- For additional practice check out the conceptual questions and the problems and exercises in the table of contents for the online text linked above.

Practice problems

- 1) A parrot flies at a speed of 10m/s in still air.
 - a) If he flies into a 2m/s headwind, how fast will he be traveling relative to the ground below?
 - b) Relative to the ground below, how fast will he travel when he experiences a 2m/s tailwind?
 - c) While flying at 10m/s , suppose the parrot encounters a 10m/s crosswind (coming at a right angle to his heading). What is his speed relative to the ground below?

Practice Problems

2) A boat is rowed at 8 km/h directly across a river that flows at 6 km/h.

- What is the resultant velocity of the boat?
- How fast and in what direction can the boat be rowed to reach a destination directly across the river

Practice Problems

3) Calculate the resulting velocity of an airplane with an airspeed of 120.0 km/h pointing due north when it encounters a wind of 50.0 km/h directed from the west.

Practice Problems Answers

1a) Speed in headwind = $10 \text{ m/s} - 2 \text{ m/s} = 8 \text{ m/s}$

1b) Speed in tailwind = $10 \text{ m/s} + 2 \text{ m/s} = 12 \text{ m/s}$

1c) speed in a right angle crosswind, The parrot and wind form two vectors that when added head to tail form two sides of a right triangle. The bird would fly a path that matches the hypotenuse of that triangle so....

$$v = \sqrt{v_x^2 + v_y^2} \quad |$$

$$v = \sqrt{\left(10 \frac{\text{m}}{\text{s}}\right)^2 + \left(10 \frac{\text{m}}{\text{s}}\right)^2}$$

= 14 m/s at 45 degrees from the original course

Practice Problems Answers

- 2a) The boat and river form two vectors that when added head to tail form two sides of a right triangle. The boat would travel in a path that matches the hypotenuse of that triangle so....

$$v = \sqrt{v_x^2 + v_y^2}$$

$$\text{Direction} = \theta = \tan^{-1}(\text{opp/adj})$$

$$v = \sqrt{\left(8 \frac{\text{km}}{\text{h}}\right)^2 + \left(6 \frac{\text{km}}{\text{h}}\right)^2}$$

$$= \tan^{-1}(6/8)$$

$$= 10 \text{ km/h}$$

$$= 37^\circ \text{ downstream}$$

- 2b) To travel straight across the boat would travel at 10 km/h at 37 degree up stream(into the current)

Practice Problem Answers

3)

$$v = \sqrt{v_x^2 + v_y^2}$$

$$v = \sqrt{\left(120.0 \frac{\text{km}}{\text{h}}\right)^2 + \left(50.0 \frac{\text{km}}{\text{h}}\right)^2}$$

$$= 130. \text{ km/h}$$

$$\text{Direction} = \theta = \tan^{-1}(\text{opp/adj})$$

$$= \tan^{-1}(50.0/120.0)$$

$$= 22.6^\circ \text{ east of north}$$

Additional Practice

For additional practice check out the conceptual questions and the problems and exercises in the table of contents from the online text linked above.
