6th Grade Clarinet

May 13th, 2020

6th Grade Clarinet
Lesson: May 13th 2020

Objective/Learning Target:
Students will be able to identify specific intervals.

Specific Intervals

- **Specific intervals** are measured both on the staff and in half steps on the keyboard.
- As you learned in the previous lesson, C to D and C to D \flat are both generic seconds. Specifically, however, C to D is one half step larger than C to D \flat .

- Let's learn a few specific intervals.

Major Second

- A **major second** is made up of two half steps.
- C to D is a major second since it is a generic second on the staff and two half steps on the keyboard.

M2

Major Third

- A **major third** is made up of four half steps.
- C to E is a major third.

Perfect Fourth

- A **perfect fourth** is made up of five half steps.
- C to F is a perfect fourth.

Perfect Fifth

- A **perfect fifth** is made up of seven half steps.
- C to G is a perfect fifth.

P5

Major Sixth

- A **major sixth** is made up of nine half steps.
- C to A is a major sixth.

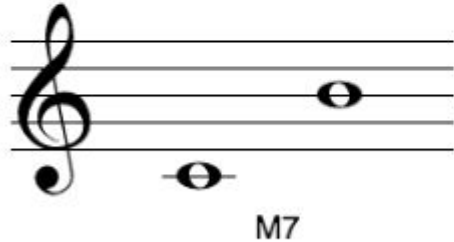

M6

Major Seventh

- A **major seventh** is made up of eleven half steps.
- C to B is a major seventh.

Perfect Octave

- Finally, a **perfect eighth** (or **perfect octave**) is made up of twelve half steps.
- C to C is a perfect eighth.

Minor Intervals

- The terms “major” and “perfect” refer to the interval's **quality**.
- Only seconds, thirds, sixths, and sevenths can have a major quality. Firsts, fourths, fifths, and eighths use “perfect” instead.
- Next, let's discuss **minor** intervals.
- A minor interval has one less half step than a major interval.

Major

Minor

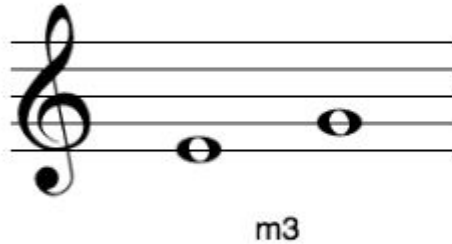

Minor Third

- For example: since C to E is a major third (4 half steps), C to E \flat is a minor third (3 half steps).

Minor Third

- E to G is also a minor third (since E to G# is a major third).

- Since minor intervals transform from major intervals; only seconds, thirds, sixths, and sevenths can be "minor".

Augmented Interval

- An **augmented** interval has one more half step than a perfect interval.

Augmented Fourth

- Since C to F is a perfect fourth (5 half steps), C to F# would be an augmented fourth (6 half steps).

Augmented Fourth

- F to B is also an augmented fourth (since F to B \flat is a perfect fourth).

A4

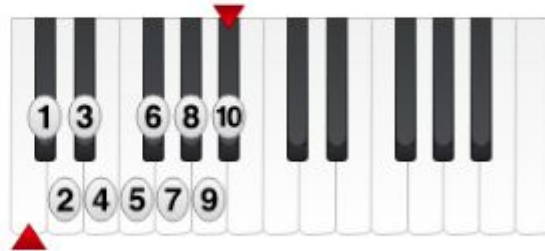

Augmented Intervals

- Major intervals can be augmented by adding a half step.

Augmented Sixth

- For example, since C to A is a major sixth (9 half steps), C to A# is an augmented sixth (10 half steps).

Augmented Sixth

- $D\flat$ to B is also an augmented 6th (Since $D\flat$ to $B\flat$ is a major sixth).

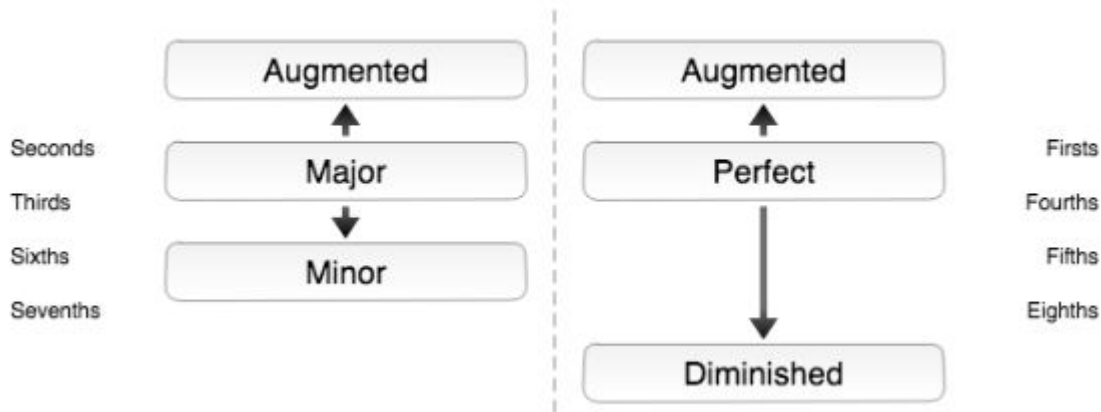

A6

Diminished Interval

- A **diminished** interval has one less half step than a perfect interval.

Diminished Fifth

- Since C to G is a perfect fifth (7 half steps), C to G \flat would be a diminished fifth (6 half steps).

Diminished Intervals

- Minor intervals can also be diminished by subtracting a half step.

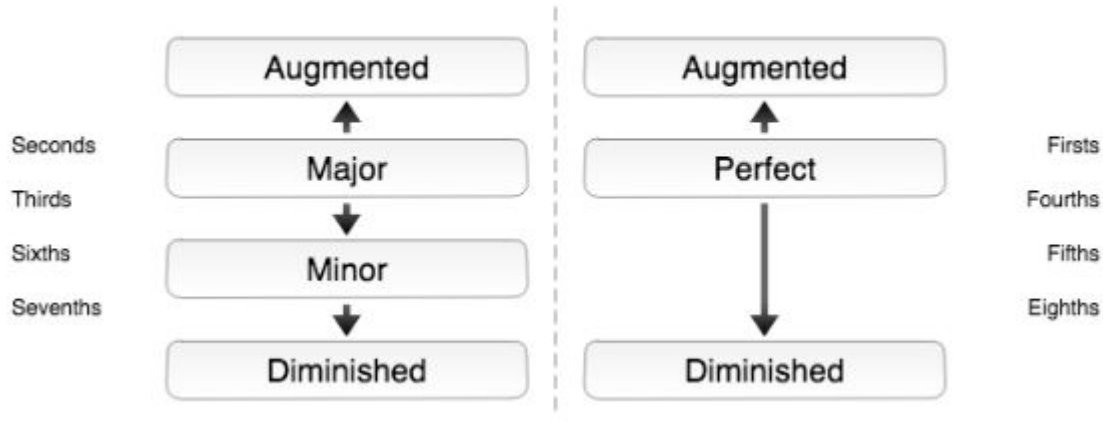

Diminished Seventh

- Recall that C to B is a major seventh (11 half steps) and C to B \flat is a minor seventh (10 half steps).
- C to B $\flat\flat$ is a diminished seventh (9 half steps).

Regular Intervals vs Perfect

- This chart shows the relationship among the different interval qualities.

Half Steps Chart

- This chart shows the number of half steps that each specific interval contains.

| | Diminished | Minor | Perfect | Major | Augmented |
|---------|------------|-------|---------|-------|-----------|
| First | | | 0 | | 1 |
| Second | 0 | 1 | | 2 | 3 |
| Third | 2 | 3 | | 4 | 5 |
| Fourth | 4 | | 5 | | 6 |
| Fifth | 6 | | 7 | | 8 |
| Sixth | 7 | 8 | | 9 | 10 |
| Seventh | 9 | 10 | | 11 | 12 |
| Eighth | 11 | | 12 | | 13 |
